

The Founder Template

A reusable, AI-assisted process for turning messy founder notes into a scoped, ticketed MVP plan. Copy it, swap in your own startup and domain, and work top to bottom. The point is not to copy the example. It is to copy the **execution system**: validate, scope, plan, build, test, and explain.

The 10-step workflow

1 Paste your notes

Customer calls, founder notes, feedback, ideas. Raw and messy is fine.

2 Extract the problem

The real problem, who has it, how they cope today, what hurts.

3 Compare solution options

List three options; choose the smallest one that is still useful.

4 Define scope

Decide what is in scope now, and what to skip for the first version.

5 Create architecture

Simple flow: input, AI, validation, human review, output.

6 Create tickets

Title, user story, acceptance criteria, definition of done.

7 Build through GitHub

Ticket, branch, code, test, PR, review. AI changes stay human-gated.

8 Evaluate

Score content quality, domain fit, and system reliability (1 to 5).

9 Final summary

Problem, MVP chosen, what was built and tested, what improves next.

10 Launch page

Turn the scope into a waitlist page and validate demand early.

Run it with MVPFlow AI

Deterministic demo (no API key needed). For your own problem in any domain, set `ANTHROPIC_API_KEY` (or `GROQ_API_KEY`) and `USE_LLM=true`.

```
python -m app.cli \
  --input examples/restaurant_founder_notes.txt \
  --output docs/output.md \
  --landing landing.html --tickets-dir tickets \
  --domain restaurant
```

What else you get (the kit)

prompts/ the six LLM prompt templates, one per step.

SKILL.md / AGENTS.md instruction templates for steering Claude or Codex to follow this workflow.

docs/ worked examples (problem statement, research, MVP plan, Jira backlog) showing what good output looks like.

Founders do not need to copy your domain. They copy your execution system.
